

Quality Bulletin

Published by Supplier Quality Assurance Department

Dear All,

Latest, The Supplier Quality Assurance observed many problems associated with corrosion appeared on delivered materials and parts produced from them. This issue mainly concerns material AMS 5591.

We would like to pay Your attention to the fact that some species of materials require special treatment, and even lack of corrosion protection for few hours may cause the first sign of corrosion. That kind of material require to appropriate usage of corrosion protection methods for all corrosion sensitive materials on each production stage, throughout:

- Incoming material inspection,
- Appropriate preservative selection,
- Continuous conservation (if needed),
- Systematical, periodical control of preservatives,
- Exchange of preservatives, which are out of specification,
- Preservative test results monitoring,
- Visual control during entire production time, with appropriate system control if needed
(fiberscope, magnifying glass)

Attention:

Preservation requirement must be applied for parts production (technology) to protect material and meet Customer requirements.
